

Manage and operate applications, infrastructure and AI at the edge

The Edge Computing Platform for On-site Edge Applications

avassa.io

Uptime

Maximized application and AI model availability through **offline operational excellence**

Operational excellence

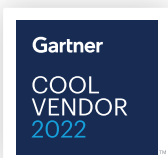

Day two operations with **proactive remote infrastructure and application monitoring, and trouble-shooting**

Compliance

Security posture that is **robust and adapted for edge**

Innovation

A cloud-like self-service experience and **frequent deployments for innovation and competitive advantage**

avassa

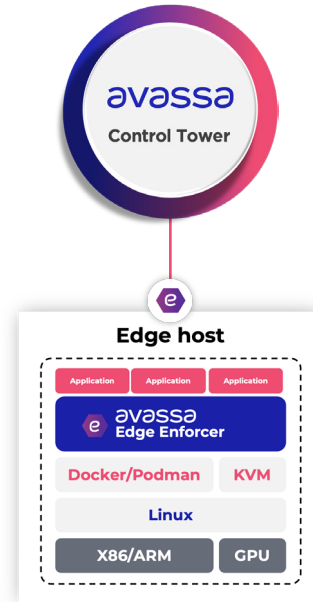

Solution components

Avassa Edge Platform

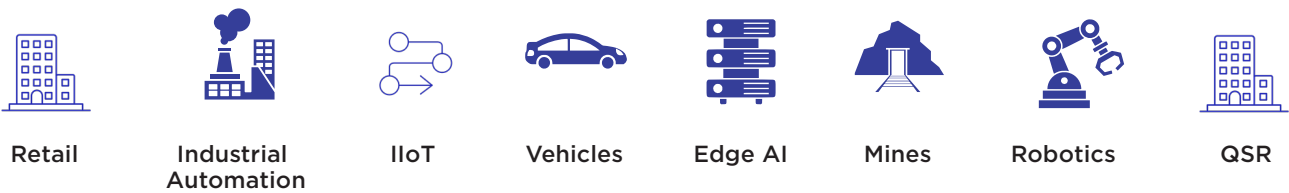

The Avassa Edge Platform is an all software solution and consists of two components:

The **Avassa Control Tower**, available as a service or installed on-premises, does what it says: it controls your distributed containerized applications including VMs, and operating systems updates through a user interface and APIs.

The **Avassa Edge Enforcer** is a container application installed on each host. It provides all required application services to enable unique edge site autonomy and application continuity while having a uniquely small performance footprint.
